Migration and Health Equity: Priority Areas for ASEAN Community 2025

By Danielle Lynn Goh

Migration has become increasingly complex and diverse. While migration can present economic opportunities and growth, at the same time, migrants, in particular low-wage migrant workers, undocumented migrants, and refugees, often face differential access to healthcare services, are more at risk of poverty, and are more likely to live in poorer living conditions. The <u>UN 2030 Agenda</u> for Sustainable Development recognises the need to incorporate migration to make better progress towards the sustainable development goals and targets. On the regional level in Southeast Asia, the health of migrants has been included in <u>ASEAN's post-2015 agenda</u>. However, there are groups of migrants such as low-wage migrant workers and refugees that are not sufficiently included in national healthcare systems.

Differential Access to Healthcare

There is still a long way to go in terms of ensuring healthcare access and equity for migrant workers globally. In 2023, the World Health Organization (WHO) stated that the world is <u>off track</u> to make significant progress in achieving universal health coverage (UHC) by 2030. The <u>Migrant Integration Policy Index 2020</u> found that legal migrants, undocumented migrants and refugees are informed about their entitlements and use of health services in only 19 out of the 56 countries measured. In Southeast Asia, low-wage migrant workers in the region are especially

MIGRATION

vulnerable to health threats. An example would be migrant domestic workers, who are often excluded from labour and social security policies of the state.

Health risks of Refugees Exacerbated by Climate Change and Conflict

Climate change and conflict are resulting in more people being forcibly displaced worldwide. According to the UN, by the end of 2023, the global refugee population increased by 7 per cent, reaching 43.4 million, driven increasingly by ongoing conflicts and violence, these include in Sudan, Myanmar and in Gaza. The health implications for both refugees and host populations include malnutrition, increased risk of vector-borne diseases and water-borne diseases, heat-related morbidity and rise of infectious diseases. The relationship between health, migration and climate change is still largely unexamined, and more research needs to be done to highlight their linkages in specific migrant communities.

Migration and Health in ASEAN Community 2025

The health of migrants has been one of the priority areas in ASEAN's Post-2015 Health Development Agenda. Among the targets set by ASEAN in line with the sustainable development goals, includes that all ASEAN member states should work towards <u>at least 80 per cent</u> of documented migrants having access to healthcare in receiving countries by 2020. While there have been <u>improvements</u> in UHC coverage of ASEAN member states since 2000, there are still gaps that remain. For example, more data is needed on work injury compensation schemes and policies, long-term chronic diseases, gender inequalities, as well as issues faced by refugee populations.

In relation to building a more resilient ASEAN Community, the health of migrants should continue to be a priority for ASEAN, and should also address the specific challenges and gaps that more vulnerable groups such as low-wage migrants and refugees face. In Southeast Asia, most states do not have formal mechanisms for asylum seekers and refugees. National responses and policies to the movement of refugees are also often reactive. Policy makers should prioritise the linkages between migration, health and climate security, and to recognise that the welfare of migrants is integral to the security of the host country. In the context of SDGs and Universal Health Coverage targets, migration must be integrated in global health efforts. Furthermore, beyond a focus on diseases and their spread, the social determinants of care of migrants must also be considered – this includes their well-being, living environment, as well as educational and employment opportunities.

Comment: What the world can learn from China about tackling climate change

As Chinese companies steadily dominate global market share across various sectors and align their business goals with clean energy and low-carbon solutions, there is a prime opportunity for foreign businesses operating in China to distinguish themselves by becoming first-movers in East-West regulatory collaboration. A good example here would be the collaboration between European and Chinese electric vehicle makers.

Analyzing market power of the agricultural industry in Asia

This paper seeks to assess the presence of market power in primary foods industries in Asia. Given information constraints, it proposes a novel methodology that leverages input-output tables across 43 Asian countries, to measure markups (the difference between the selling price of a good, and the cost of producing the good) as estimates of market power by companies over producers (e.g., farmers, hunters, fishermen). It finds that market power has been increasing from 1995 to 2015, although countries with greater integration into the global economy (trade, investments) helps to reduce the market power of companies relative to producers, thus stressing the need for more economic integration in critical primary foods industries. **Adrián Rodríguez del Valle and Esteban Fernández-**Vázquez, Economic Analysis and Policy, 81, 652-669 2024
