5 Years to 2030: The Need for Domestic Prioritisation of SDG 5

By *S. Nanthini*

International Women’s Day brings with it an opportunity to reflect on the progress of gender equality around the world. This year is especially pivotal. Not only does 2025 mark the 25th anniversary of the Women, Peace and Security Agenda – a seminal resolution formally recognising the role of gender in peace and security processes – but it also highlights the five years remaining for the deadline of the Sustainable Development Goals (SDG). This year provides an opportunity to reflect on the progress that has been made – as well as – the work still to be done.

There has been progress made worldwide. For example, women now hold approximately a quarter of parliamentary seats worldwide, a significant increase from even a decade ago. In Southeast Asian countries overall, 23 per cent of seats are held by women with the highest participation rate in Timor-Leste at 38 per cent. In terms of official development assistance (ODA) to the region, ODA specifically to support gender equality has increased substantially from 12 per cent in 2013 to 47 percent in 2022 – which has clearly translated into better outcomes for women from the region.

However, progress is not linear. The continued polarisation of

MIGRATION

the international community and a growing backlash against women's rights are having a chilling effect on its progress. In fact, in some countries around the world, women's rights are even being rolled back, worsening gender disparities. One of the world's largest development agencies, USAID is being dismantled in an effort to "reevaluat[e] and realig[n] United States Foreign Aid". Considering USAID contributions last year made up nearly 40 per cent of all aid worldwide, this is devastating to programmes around the world. Moreover, considering the US push to reintroduce the global gag order on abortion and erase policies that favour "gender ideology", women are likely to be disproportionately affected by this disruption in the global humanitarian and development sector.

What can then be done? While the impacts of these policies are likely to be felt far and wide, this may also be a chance to revamp the global humanitarian system. In particular, by allowing recipient countries to take over formerly USAID-supported activities and fill this gap on their own. In Southeast Asia, this can be done at both the regional level – through ASEAN – or the national level. ASEAN member states could work together to increase their domestic investment to support gender equality. This includes identifying opportunities to invest in gender-responsive social protection, expanding care infrastructure and improve gender – specific data availability in the region – overall, prioritising gender parity as a key issue area for ASEAN.

This is not new for ASEAN. In fact, there has already been significant work in this area as

demonstrated by several regional commitments over the years such as the 2004 Declaration on the Elimination of Violence Against Women in the ASEAN Region, the 2017 Joint Statement on Promoting Women, Peace and Security in ASEAN and the 2022 ASEAN Regional Plan of Action on WPS. As such, this may prove to be an opportune topic on which for ASEAN to take domestic ownership and continue to progress regionally, regardless of international support.

In order for humanity to have any hope of achieving SDGs in a timeframe that not only meets the 2030 deadline, half the global population cannot be disregarded. Considering global headwinds, it may now be necessary for recipient countries to look towards their own needs; to internalise gender equality as a significant domestic priority and work towards the achievement of SDG 5.

US energy secretary says global warming a side effect of modern economy

U.S. Energy Secretary Chris Wright said that global warming is a side effect of building the modern world, and vowed to end former President Joe Biden's climate policies to promote growth of fossil fuels. Wright made the comments to kick off CERAWeek, the nation's largest energy conference, in Houston.

Singapore to study how worst-case scenarios affect local sea-level rise projections

Singapore Researchers from Singapore will update sea-level rise projections for the Republic and the region by taking into account what are known as "black swan" events. This move to update the Republic's projections for sea-level rise – which is estimated to be up to 1.15m by 2100 – comes after a Nanyang Technological University (NTU) study showed that global sea-level rise could be higher than earlier projections if extreme events were considered.

Greenhouse gases reduce the satellite carrying capacity of low Earth orbit

Anthropogenic contributions of greenhouse gases in Earth's atmosphere have been observed to cause cooling and contraction in the thermosphere, which is projected to continue for many decades. Decreasing density reduces drag on debris objects and extends their lifetime in orbit, posing a persistent collision hazard to other satellites and risking the cascading generation of more debris.

Technology the best bet to transform Africa's food systems

Agriculture accounts for nearly 60% of total employment in Sub-Saharan Africa, but agricultural productivity continues to lag behind other regions due to the lower adoption of simple technological solutions like the use of drought-resistant seeds, drones and satellite imagery. Local governments and regional bodies play important roles in helping farmers access the necessary skills and tools to engage in sustainable and profitable agriculture.

Climate change threatens food security—can data be the real hero?

Climate change and more intense and frequent extreme weather effects plague the agricultural industry, disrupting pest cycles and crop yields, and in turn strategic and operational farming decisions. Artificial intelligence and data analytics offer potential to reduce these disruptions. Collaborative networks and digital platforms can also promote real-time information exchange among farmers, building a common reservoir of knowledge and enhancing resilience to present and future challenges.
